

Cross Mobile Platform Website Viewer

In order to make websites available in different App Stores and to make companies, which have no concrete idea for an app, to present on these platforms, we developed a generic mobile app, which runs on all common mobile operating systems.

Initial situation

Because of the small keyboards, accessing websites on mobile devices via URLs is not very convenient. Often when a user is underway, he has not the time for using the small keyboard of his mobile phone. A mobile app in contrast can be started with one finger.

Produktbeschreibung

The Cross Mobile Platform Website Viewer is an app which displays a saved URL. At the start of the app, a defined website will be displayed. Required login information can be saved in the app and if needed they can be sent to the webserver. The Cross Mobile Platform Website Viewer runs on all common mobile operating systems. The application is written in only one programming language and if needed, we translate it for your required target platform.
